

Cosmetic Insights: Navigating Cosmetics Trends and Consumer Behavior with Tableau

Phase 7 – Project Demonstration

1. Purpose

This phase involves recording an end-to-end explanation video of the Cosmetic Insights solution — walking through the problem, the data, the Tableau build, and the final web-embedded output — so that evaluators or stakeholders can understand the full solution without needing a live walkthrough.

2. Recording Checklist

- Screen recording tool ready (e.g., OBS Studio, Loom, or built-in phone/PC recorder).
- Tableau workbook open with dashboard and story tabs ready to switch between.
- Flask web app running locally (or deployed) with the embedded dashboard/story loaded.
- Microphone tested for clear narration.
- Keep total length to 5–8 minutes — concise and structured.

3. Suggested Video Script / Storyboard

Use this as a talking-point script while screen-recording. Each section maps to roughly 1 minute.

Scene 1 – Introduction (0:00–0:45)

“Hi, I’m [Your Name], and this is my project, Cosmetic Insights — a Tableau-based analytics solution built to help cosmetics companies understand market trends, pricing, and skin-type coverage across brands.”

Scene 2 – Problem Statement (0:45–1:30)

“The cosmetics industry generates huge amounts of product and consumer data, but brands often lack an easy way to visualize pricing trends, brand performance, and skin-type suitability. This makes it hard to spot shifting consumer preferences or respond quickly to product concerns.”

Scene 3 – Dataset Walkthrough (1:30–2:15)

“Here’s the dataset I used — it includes brand, product category, price, rank, and skin-type suitability across Dry, Oily, Combination, Normal, and Sensitive categories. I cleaned and prepared this data before bringing it into Tableau.”

Scene 4 – Dashboard Demo (2:15–4:00)

“This is the main dashboard. I can filter by brand, category, skin type, and price range. Here you can see [walk through 2–3 charts — e.g., price distribution, brand market share, skin-type heat map] and how the visuals update in real time as filters change.”

Scene 5 – Story Walkthrough (4:00–5:30)

“Next is the story, which walks through three real business scenarios: monitoring consumer preferences, addressing product concerns, and predictive analysis for product innovation. [Click through each scene and

narrate the insight shown.]”

Scene 6 – Web Integration (5:30–6:30)

“Finally, I embedded this dashboard and story into a Flask web application, so stakeholders can access the insights directly through a browser without needing Tableau installed.”

Scene 7 – Closing (6:30–7:00)

“That wraps up my Cosmetic Insights project — from raw data to actionable, real-time insights for the cosmetics industry. Thank you for watching.”

4. Post-Recording Steps

- Trim any dead air or mistakes using a free editor (CapCut, iMovie, or the recording tool's built-in trimmer).
- Export as MP4, keep file size reasonable for easy upload.
- Name the file clearly, e.g., 'Cosmetic_Insights_Demo_Video.mp4'.
- Upload to the '7. Project Demonstration' folder alongside this document.

This completes Phase 7 (Project Demonstration): a ready-to-use script and checklist for recording the final explanation video.
